

Climate Change: Challenges and Opportunities for Hydropower

Overview of IHA initiatives on Climate Change issues

ICOLD Technical Committee Y

COMMISSION INTERNATIONALE
DES GRANDS BARRAGES

INTERNATIONAL COMMISSION
ON LARGE DAMS

Agenda

- Hydropower 2050 vision
- GHG emissions and the G-Res tool
- IHA Climate Resilience Guide

Hydropower 2050

Identifying the next
850+ GW towards
Net Zero

Hydropower Sector Climate Resilience Guide

For existing and future hydropower projects

We need hydropower to meet Net Zero targets:

- To limit temperature rises to <2C world needs at least 850 GW additional by 2050
- Hydro can fill the hole left by coal
- Hydropower's role will increasingly shift to enhancing system flexibility and supporting variable wind and solar PV

Global electricity generation by source 2050, Transforming Energy Scenario (IRENA 2020 – Global Renewables Outlook: Energy Transformation 2050)

Hydropower 2050 report

Hydropower needs to increase capacity by at least 850 GW by 2050 in order to support the energy transition and tackle climate change

- Hydropower today
- Why we need 850+ GW
- What if we don't build new hydro?
- Sustainability
- Potential global hydropower capacity
- The hydropower 'pipeline'
- Policy recommendations

<https://www.hydropower.org/publications/hydropower-2050-identifying-the-next-850-gw-towards-2050>

Achieving net zero

Future hydropower development

Key

- Remaining potential GW
- Pipeline GW
- Installed GW

In most regions the potential far exceeds what is needed

Region	Indicative Potential Hydropower Capacity (GW)	Installed Capacity in 2020 (GW)
Africa	630	38
Europe	350	254
East Asia and Pacific	1,100	501
North and Central America	620	205
South America	500	177
South and Central Asia	600	154

We Can with Hydropower

- Hydropower as a solution to climate change is key message of all IHA communications
- #WithHydropower campaign <https://with.hydropower.org/>
- IHA ensure high-level presence at global climate events such as COP26, COP27
- Sustained engagement and advocacy towards policymakers, investors and the public

with.hydropower.org
#WithHydropower

"Variable renewable energy - wind and solar - supported by storage - batteries, pumped storage and green hydrogen - can take us to a zero emission energy world."

Malcolm Turnbull, 29th Prime Minister of Australia

With hydropower we can...

Provide affordable energy for generations

The most severe global energy crisis in decades has hit household energy bills in many regions of the world...

READ MORE →

Store wind and solar energy in water

Wind and solar power will be crucial components of the renewable systems we need to replace fossil fuels...

READ MORE →

Protect communities from floods and droughts

Develop renewable energy sustainably

Pascal Radue
@pascalradue

"WE CAN, WITH HYDROPOWER" - you will certainly hear this phrase more often in the coming days and weeks. Watch my short video talking about the new campaign, organized by the @iha_org and what this campaign means for #climatechange and our #NetZero2050 targets. #WithHydropower

"At COP26 we saw positive progress with further commitments to shift away from fossil fuels. But it is meaningless unless we take action now and invest in clean energy. Sustainable hydropower will play a key role in bringing more renewables onto the grid as we move away from coal."

Helen Clark, Former Prime Minister of New Zealand

GHG emissions from reservoirs

- How do they form?
- How to measure: G-res tool

GHG Emissions from reservoirs

(A) Pre-impoundment

(B) Post-impoundment

GHG Emissions from reservoirs

Measuring Emissions from reservoirs

G-res tool

- Simple-to-use, web-based tool that can be used to predict GHG emissions from reservoirs without going to the field to take measurements.
- Launched May 2017
- <https://g-res.hydropower.org/>

Initiative partners:

hydropower.org

In collaboration with:

Results analysis 500 reservoirs:

Emissions intensity of ~500 reservoirs
Source IHA

Results analysis 500 reservoirs:

Hydropower GHG emissions

Results of 2021 study* confirm hydropower is a **low-carbon technology**

Hydropower global median life-cycle emissions: **23 gCO₂-eq/kWh**

Aligned with IPCC and the range between 25th and 75th percentile is smaller

	Study dataset	IPCC AR5
Min	-922	0
Q1	5	1
Median	23	24
Q3	99	200
Max	4295	2200

* *Water Security and Climate Change: Hydropower Reservoir Greenhouse Gas Emissions (2021)*

GHG eligibility requirements

Use G-res tool for site specific GHG estimations

Assessing the net greenhouse emissions of a reservoir using such G-res tool is now an expectation for:

- ✓ demonstrating sector's basic good practice
- ✓ financing a hydropower project through climate finance*
- ✓ sustainability reporting

Thresholds:

- ☐ a power density of **more than 5 W/m²** or
- ☐ an emissions intensity of **less than 100 gCO₂e/kWh**.

** New projects (after year 2020) should have < 50 gCO₂-eq/kWh*

Adaptation Resilience Guide

The guide provides a practical and useful approach for **identifying, assessing** and **managing** climate risks to enhance the climate change resilience of new and existing hydropower projects.

It provides international industry good practice on how to **incorporate climate resilience** into hydropower project **planning, design and operations**.
2019

hydropower.org

A guide for the hydropower sector

Worldwide application

Industry welcomed the guide

Financial institutions are the majority of the organisations to request the guide be applied.

● Pilot projects before May 2019

● Projects after May 2019

Six Core Principles

- ✓ All stages
- ✓ All types
- ✓ All scale
- ✓ All geographies and weather
- ✓ Key functions
- ✓ All levels of data

Innovative methodology

Addressing uncertainty

Decision Making under
Uncertainty (DMU)

Bottom-up approach

Stress test to find system risks

Monitoring, Evaluation and
Reporting plan

Phase 3: Climate stress test

3.1 Comprehensive Approach

3.2 Semi-comprehensive approach

3.3 Limited approach

Providing guidance

Resilience measures

Annex A. Climate stressors list

For electricity production

- Generation shifts
- Load factor changes
- Min environmental flows variations

For access road

- Increased debris
- Increase risk of slope instability

For reservoir

- GLOFs
- Sediment load increase

Annex C. Examples of adaptation measures

For electricity production

- Improvement of hydrological forecasting tools
- Reassessment of the type of scheme (base load/peaking and run-of-river/storage)
- Revised optimal minimum operating level

For access road

- Debris screens, drainage and culverts
- Additional slope protection

For reservoir

- Glacial monitoring
- Controlled glacial reservoir breach
- Change of dam type to allow overtopping
- Additional sediment management strategies

functional

structural

Alignment with other frameworks

Used as a reference for international institutions, multilateral banks

hydropower.org

Conclusion

- Opportunity: We need more hydropower!
- Challenge: Reservoirs result in net GHG emissions; can be evaluated with the G-Res tool
- Challenge: Effects of Climate Change on infrastructure: Resilience Guide
